M.Sc. - Computer Applications and Information Technology**

Acknowledgement

We are really grateful and would like to express our special thanks of gratitude to our project guide Mrs Beena Manojkumar who gave us the opportunity to do this amazing project named Real Estate Management System.

She also helped us in completing our project. We came to know about so many new things under her guidance. We are really thankful to her for providing guidance and helping us at every single stage of our project.

CHAPTER – 1

Introduction

1.1 Organization Profile:-

The organization behind this Real Estate Management System (REMS) is AASHRAY REALTY. With over 9 years of experience, the company specializes in property sales, rentals, and management services. The organization aims to streamline real estate operations and provide a centralized platform for all property-related activities.

NAME	AASHRAY REALTY
EMAIL	aashish.yadav@aashrayrealty.com
OWNER	Mr. Ashish Yadav
BUSINESS TYPE	B2C
ADDRESS	1003 one world west, Iskcon, ambli, Ahmedabad Pin :- 380058
CONTECT NO	+91 97235 16494

1.2 System Details:-

1.2.1 Existing System: -

1. Visit the Office:

- The customer physically visits to the office.
- They may be greeted by a real estate agent or receptionist.
- The customer can express their interest in renting or purchasing a property.

2. Inquiry about Property:

- The customer provides information about their preferences, such as budget, location, and property type (e.g., apartment, house, commercial space).
- agent will use this information to suggest suitable properties that match the customer's requirements.

3. Check Availability:

- verifies the availability of the properties mentioned in the inquiry.
- They may need to contact property owners or landlords to confirm the status of the properties.

4. View Property:

- The customer arranges to view the selected properties.
- agent will accompany them to the properties and provide additional details about the features, amenities, and neighbourhood.
- The customer can inspect the property, ask questions, and assess if it meets their needs.

5. Negotiation:

- If the customer is interested in renting or purchasing a property, negotiations begin.
- The customer and the property owner discuss the terms of the agreement, including rent or purchase price, deposit, maintenance responsibilities, and other relevant conditions.

6. Rent/Purchase Property:

- After negotiations are finalized, the customer decides to either rent or purchase the property.
- If the customer chooses to rent, they will sign a lease agreement.
- If the customer chooses to purchase, they will sign a purchase agreement and proceed with the necessary legal formalities.

7. Book the Property:

- To secure the property, the customer may be required to pay a deposit.
- The deposit amount can vary depending on the property type and local customs.

8. Documentation:

- Once the agreement is signed, the necessary documentation is completed.
- This may include:
 - Lease agreement or purchase agreement
 - Rental deposit or down payment
 - Proof of identity and address
 - Income verification (if applicable)
 - Other required documents as per local regulations

1.2.2 Limitation Of Existing System: -

1. **Reports are not generated:** The system may not provide any reports or analytics, making it difficult to track performance, identify trends, and make informed decisions.
2. **Customer reviews are not available:** Customers may not be able to provide feedback or ratings for properties, limiting the ability to gauge customer satisfaction and make improvements.
3. **Customer needs to visit the office for inquiry:** Customers may need to physically visit the office to inquire about properties, which can be inconvenient and time-consuming.
4. **Manual record of data can be lost:** If data is recorded manually, there is a risk of data loss or errors, which can lead to inaccuracies and inefficiencies.
5. **The office is not open 24/7 hours and festivals:** The physical office may have limited operating hours, making it difficult for customers to inquire or conduct business outside of regular hours or during holidays.
6. **Customer cannot know about discounts and offers:** Customers may not be aware of available discounts and offers, potentially leading to missed opportunities and dissatisfaction.

1.2.3 Proposed System: -

1 Property Search:-

- **Property Registration:** Property owners can register their properties on the platform, including detailed descriptions, photos, and other relevant information.
- **Property Categorization:** Properties can be categorized based on type (residential, commercial, etc.), location, and other relevant criteria.
- **Property Search:** Users can search for properties based on various criteria, such as location, price range, property type, and amenities.

KS SCHOOL OF BUSINESS MANAGEMENT M.Sc(CA & IT)

- **Property Details:** Each property listing will include detailed information, such as:
 - Property description
 - Photos and videos
 - Location
 - Pricing and payment terms

2 Interactive Maps

- **Map View:** Users can view properties on a map to get an understanding of the neighborhood and nearby amenities.
- **Neighborhood Insights:** Information about the locality including schools, hospitals, shopping centers, and transport links.

3 Alerts and Notifications

- **Rent Due Date Notifications:** The system will send notifications to tenants and property managers when rent is due.
- **New Listing Notifications:** The system will send notifications to users when new properties are listed.
- **Lease Expiration Notifications:** The system will send notifications to property managers and tenants when leases are approaching expiration.
- **System Updates and Maintenance Notifications:** The system will send notifications to users when the system is undergoing updates or maintenance.

4 Booking and Scheduling

- **Appointment Booking:** Users can schedule property viewings or meetings with builder through the website.

5 EMI and Financial Tools

- **EMI Calculator:** Helps users estimate EMI payments based on property price, no of years and interest rates.

6 User Accounts and Management

- **Profile Management:** Users can create and manage their profiles, including saved searches and favorite properties.
- **Shortlisting:** Option to save and manage a list of favorite properties for future reference.

7 Reviews and Ratings

- **Property Reviews:** User reviews and ratings for properties to provide feedback and insights.

8 User Experience

- **Responsive Design:** The website is designed to be user-friendly

- **Easy Navigation:** Intuitive interface for searching, filtering, and browsing properties.

9 Customer Support Integration

- **FAQs and Help Center:** Offer self-service options with frequently asked questions, tutorials, and guides.

These features are designed to offer a comprehensive and user-friendly experience for anyone looking to engage with the real estate market.

In conclusion, the Real Estate Management System will provide a comprehensive platform for property owners, tenants, and property managers to interact and conduct transactions efficiently. The system will include a range of features and functionalities, including property listings and management, tenant management, report generation, notifications and alerts, security and authentication, customer reviews and ratings, and search and filter functionality.

1.3 Scope Of System

1. Property Listings Management

- Map Integration: Integrate with Google Maps or similar services for location-based searches and property pinning
- Residential Properties: provides extensive listings of residential properties available for sale and rent. This includes apartments, independent houses.
- Filters and Search Options: Users can search properties using various filters like location, price range, property type, size, amenities, furnishing status, and more
- Property Database: Maintain a centralized repository of property listings with detailed descriptions, images, videos, and floor plans.

2. New Projects

- New Developments: provides detailed information about new and upcoming residential and commercial projects across various cities in Gujarat.
- Developer Collaborations: The platform collaborates directly with real estate developers to showcase their new projects, offering a range of options from luxury apartments.

3. Commercial Real Estate

- Commercial Listings: also lists commercial properties, such as office spaces, retail outlets, co-working spaces, and industrial properties available for lease or purchase.
- Detailed Information: The platform provides comprehensive details on commercial properties, including location, size, price, infrastructure, and other.

4. Property Management: Admin can manages properties, including:

- Updating property information
- Adding or removing photos and videos
- Changing pricing and payment terms
- Managing property availability

5. Verified Listings and Visual Content: Emphasizes verified listings with high-quality images, videos, and virtual tours to enhance the user experience.

6. User Support and Guidance

- Customer Service: provides customer support to assist users with their queries and issues, offering both online and offline support channels.
- Advisory Services: also provides expert advice and guidance to buyers and renters. This may include assistance with legal paperwork, market insights, financial planning, and more.

7. **Map-Based Search:** Offers a map-based search feature that allows users to visually explore properties by location, helping them understand the area and its connectivity better.

8. **Notifications and Alerts:-**

- Automated Alerts: Notify clients, agents, and tenants about property updates, payment reminders, and maintenance schedules.
- Event Reminders: Set reminders for important events like lease renewals, property inspections, or contract deadlines.
- Rent payment notification

9. **Customer Support Integration:-**

- FAQs and Help Center: Offer self-service options with frequently asked questions, tutorials, and guides.

10. **Marketing and Promotion**

- Property Promotion: Promote properties on multiple platforms, including social media, real estate portals, and email campaigns.
- Social Media Integration: Share listings and promotions directly to social media channels.

1.4 Objectives

1. **More numbers of customers can be reached:** The system aims to expand the reach and attract a larger number of customers. This could be achieved through enhanced online presence, targeted marketing, and improved customer experience.
2. **It will provide more convenient experience for customers:** The system aims to offer a more convenient and user-friendly experience for customers, potentially through features such as online booking, easy search options, and 24/7 accessibility.
3. **Admin can manage the site easily:** The system will be designed to be user-friendly and efficient for administrators to manage, handle inquiries, and track performance.
4. **Required reports are generated:** The system will generate necessary reports and analytics, providing valuable insights for administrators to make informed decisions and monitor performance.
5. **Customer review & rating is available:** The system will allow customers to provide feedback and ratings for properties, enabling the property management company to gauge customer satisfaction and make improvements.

These objectives highlight the desired improvements and benefits of the proposed system, addressing the limitations of the existing system and aiming to provide a better overall experience for both customers and property managers.

CHAPTER – 2

Proposed System Requirement Gathering

2.1 Stakeholder Of System

➤ Admin:

- Admin will be responsible for maintaining system's feasibility and durability. They are responsible for various aspects of system management, user support, and ensuring the system meets regulatory requirements.
- Manage Profile , properties, customer ,inquiry, company details, discount & offers.
- **Property Managers:** Responsible for overseeing the day-to-day operations of properties, including tenant management, maintenance, and financial reporting.
- **Developers & Designers:** They will design, build, test, and maintain the e-commerce platform.

➤ Customer:-

- **Property Buyers and Renters:** Individuals searching for properties to buy or rent who use the website for browsing listings, virtual tours, or contacting agents.
- **Tenants:** Current renters who might use the system to submit maintenance requests, or access important documents.
- **Payment:** Customer can Pay the rent and token fee.

➤ **Visitor:** People who use the system to view property, feedback, rating and offers.

2.2 Requirement Gathering Technique Used

Description :

Techniques used to obtain the specifics of what the system should achieve.

Example:

1. Interviews: Conducting face-to-face interviews with hostel administrators, staff, and students to understand their needs and requirements.

2. Surveys and Questionnaires: Distributing surveys and questionnaires to gather information from a larger group of students and staff.

3. Observation: Observing hostel operations, processes, and interactions to identify areas for improvement and it provides insight into practical needs and challenges.

4. Document Analysis: Review existing documentation related to hostel management, such as current systems, policies, and procedures, to understand the current state and areas needing enhancement.

5. Prototyping: Create prototypes or mock-ups of the system to gather feedback from stakeholders. This iterative approach helps refine requirements through user interaction with a preliminary version of the system.

6. Online Research: Conducting online research to identify best practices and industry standards and functionalities.

7. Brainstorming Sessions: Engage in brainstorming sessions with key stakeholders to generate ideas and identify requirements based on their input and experiences.

8. Feedback from Existing Systems: Analyse feedback and complaints from users of existing hostel management systems to identify gaps and areas for improvement.

These techniques help gather comprehensive requirements for the Hostel Management System, ensuring it meets the needs of users and stakeholders..

We choose Questionnaire's techniques for requirement gathering.

➤ **Stakeholder potential for Admin:**

KS SCHOOL OF BUSINESS MANAGEMENT M.Sc(CA & IT)

1. What systems or tools are currently used for property management?

Ans: Semi-Manual and paper-based records. All the work done in the Excel.

2. What are the limitations or inefficiencies of existing system?

Ans: Reports are not generated, manual data entry, inefficient communication.

3. What are the primary objectives of the real estate management system?

Ans : The main objective is to increase property visibility and lead generation. We want a system that allows us to efficiently manage listings, communicate with potential clients.

4. What search and filter functionalities are important for showcasing properties to clients?

Ans: We need advanced search and filter options, such as location with price range , property type and size to help clients find the right properties quickly.

5. Why you need the website for real estate?

Ans: Showcase Properties Effectively, Generate Leads and Inquiries, Establish Credibility and Expertise, 24/7 Accessibility.

6. Why are you think to making online platform for Real-Estate management system?

Ans: For enhances efficiency, accessibility, and automation, making property management more organized and scalable.

7. Are there any specific compliance or security requirements?

Ans: Yes, the system must comply with GDPR for data protection and include secure login for customers. And also Payment protection.

8. How do you manage maintenance requests?

Ans: We currently handle maintenance requests manually via phone or email.

9. What types of reports do you need for day-to-day operations (e.g., occupancy rates, maintenance costs, tenant feedback)?

Ans: We need daily and monthly reports on occupancy rates, maintenance costs, and tenant feedback to monitor property performance and customer satisfaction.

10. How do you handle customer inquiries and feedback?

Ans: Through email and phone, but a centralized system would be better.

11. What type of user roles will be needed, and what access levels should each have?

Ans: The system should support multiple roles, including Admin, Tenant, and Buyer/Renter, each with different access levels

12. Should there be an option to bulk import/export data (e.g., user lists, property data)?

Ans: Yes, to save time and reduce manual errors.

13. How frequently should these reports be generated, and who should have access to them?

Ans: Reports should be generated weekly, monthly, and quarterly. Admins should have access to all reports.

➤ **Stakeholder potential for Customer:**

1. What are your biggest frustrations with existing real estate websites?

Ans: Slow loading times, outdated property information, and a lack of advanced filters to narrow down search results are major frustrations.

2. What features would enhance your experience on a real estate platform?

Ans: A user-friendly interface with responsive design, advanced search filters, high-quality images, and real-time updates on property availability would be great.

3. What concerns do you have about sharing your personal information on a real estate website?

Ans: I am concerned about data security and privacy. I would like assurance that my data won't be shared without my consent.

4. What information is most important to you when viewing a property listing?

Ans: Photos, price, property details, amenities and neighborhood information.

5. Would you like to receive notifications about new property listings or price changes?

Ans: Yes, email or in-app notifications would be great.

6. Do you prefer to schedule property viewings online ?

Ans : Online scheduling is more convenient.

7. What additional features or tools would make the platform more useful for you?

Ans: A EMI calculator and neighborhood safety ratings.

2.3 Consolidated List Of Requirement

1. Property Management:

- Property Listings: Ability to create, update, and manage property listings with detailed descriptions, high-quality images, videos, and virtual tours.
- Advanced Search and Filter: Feature-rich search functionality for users to find properties based on various criteria (e.g., location, price range, property type, size).
- Map Integration: Integration with map services (ex., Google Maps) to display property locations, nearby amenities, and neighbourhood insights, Price.
- Tenant and Lease Management: Tools for tracking lease agreements, rent payments, tenant information, and lease renewals.

2. User and Customer Experience Features

- Responsive Design: Ensure the website is user-friendly and accessible on all devices.
- User Accounts and Profiles: Allow users (buyers, tenants) to create and manage profiles, save searches, favourite properties, and receive notifications.
- Contact and Communication Tools: contact forms, scheduling tools, and direct messaging for users to communicate with property managers.

3. Document Management:

- Centralized storage and organization of all relevant documents (leases, contracts, invoices, etc.).
- Easy accessibility and search functionality to quickly locate required documents.
- Secure document sharing and collaboration features for internal and external stakeholders.

4. Communication:

- Effective tenant communication channels, including email, SMS, and a tenant portal.

5. Reporting and Analytics:

- Customizable reports on property performance, tenant occupancy, and other key metrics.
- Data visualization tools to present information in a clear and understandable format.

6. Security and Data Protection:

- Secure data storage and privacy policies.
- Secure login and registration process.
- Secure payment

7. User Interface and Experience:

- Intuitive and user-friendly interface for easy navigation and operation.

2.4 Project Definition

- **Project Goal:-** To develop a comprehensive software solution that streamlines and automates various aspects of real estate management, improving efficiency, and enhancing decision-making capabilities.
- **Project Scope:**
 - Development of a comprehensive real estate management system that addresses the identified requirements .
 - Implementation of a user-friendly interface for admin, customer ,visitors.
 - The system will support multiple roles(tenants, buyer etc.)
- **Project Objectives:-**
 - Centralize and organize property information.
 - Automate tenant management tasks, including lease agreements and communication.
 - to provide a secure and efficient system for storing and accessing property related data.
 - Provide secure Payment

CHAPTER – 3

System management and planning

3.1 Feasibility Study

- A feasibility study is a preliminary study undertaken before the real work of a project starts to ascertain the likelihood of the project's success.
- It is an analysis of all possible solution to a problem and recommendation on the best solution to use.
- It involves evaluating how the solution will fit into the corporation.
- The purpose of feasibility study is not to solve the problem but to determine whether the problem is worth solving.

3.1.1 Technical Study

- The Technical Feasibility Study compares the level of technology available in the software development form and the level of technology required for the development of the product.
- Here, the level of technology consists of the programming language, the hardware resources, other software tools etc.

❖ Why Our System is Technically feasible?

- Our System just requires windows operating system, normal browser or internet.
- The feasibility to produce output in a given time because system is fast enough to handle multiple users.
- The firm has already setup environment and tools for the system.
- The facility to produce output in a given.
- Response time under certain condition.
- No extra ordinary gadgets are requiring for our system.

3.1.2 Economic Study

- The economic feasibility study evaluates the cost of the software development against the ultimate income or benefits gets from the developed system.
- There must be scope for profit after the successful completion of the project.

❖ Why Our System is Economically feasible?

- High increase in the amount of profit earned by going global.
- In economic feasibility, the most important is cost benefit analysis and our system is not much costly as per our functionality.
- Due to economic feasibility, we can estimate and make changes according to the budget.
- With this software, the manpower utilization is expected to go up by 70 – 80% approximately.

- The costs incurred of not creating the system are set to be great, because precious time can be wanted by manually.

3.1.3 Operational Study

- Operational Feasibility study tests the operational scope of the software developed.
- It is checked that if the system is actually can be useful impended and how it satisfies the requirements identified in the requirements analysis phase of the system development.

❖ Why Our System is Operationally feasible?

- Our system is very easy to use without any training.
- Our system is developed in such a way that would be easy to understand and operate.
- The system interface is standard, user friendly and provides expensive help.
- No special training is required.
- The users will use the system so user interface is as easy to understand them.
- User friendly GUI.

3.2 Hardware- Software Requirement

Hardware requirement

Processor	Intel core i5
RAM	8 GB
Hard Disk	512 GB

Software requirement

Operating system	Windows 11
Web Development Technology	HTML 5, Javascript,CSS3
Programming Language	JavaScript
Back End	MongoDB 7.0
Framework	Express JS ,React JS 18
Code Editor	Visual Studio code
Diagram Tool	Visual paradigm

3.3 System Planning

System planning is a crucial stage in developing a Real Estate Management System (REMS). It involves creating structured steps to break down the entire project, ensuring that all components are delivered on time, within scope, and with the expected quality. Here's a detailed breakdown of Work Breakdown Structure (WBS) and Gantt Chart.

3.3.1 Work Breakdown Structure (WBS)

A Work Breakdown Structure is a hierarchical decomposition of the work required to complete a project. It breaks the project down into manageable sections or tasks, helping to visualize the entire process.

❖ **Following are a few reasons for creating a WBS in a project.**

- Accurate and readable project organization.
- Accurate assignment of responsibilities to the project team.
- Indicates the project milestone and control points.
- Helps to estimate the cost, time and risk.
- Illustrate the project scope, so the stakeholders can have a better understanding of the same.

3.3.2 Gantt Chart

- Gantt chart is a type of a bar chart that is used for illustrating project schedules. Gantt charts can be used in any projects that involve effort, resources, milestones and deliveries.
- At present, Gantt charts have become the popular choice of project managers in every field. Gantt charts allow project managers to track the progress of the entire project. Through Gantt charts, the project manager can keep a track of the individual tasks as well as of the overall project progression.
- In addition to tracking the progression of the tasks, Gantt charts can also be used for tracking the utilization of the resources in the project.

3.4 Process Models

- Process models are processes of the same nature that are classified together into a model. Thus, a process model is a description of a process at the type level. Since the process model is at the type level, a process is an instantiation of it.
- The same process model is used repeatedly for the development of many applications and thus, has many instantiations. One possible use of a process model is to prescribe how things must be done in contrast to the process itself which is really what happens.
- Here are some of the most common software engineering process models but for our system we are going to use Incremental Model :
 - Waterfall Model
 - Incremental Model
 - V Model
 - Prototyping Model
 - Spiral Model
 - Concurrent Model

Incremental Model :

- Incremental model in software engineering is one which combines the element of waterfall model which are then applied in an iterative manner. It basically derives a series of release called increments which provide progressively more functionality for the client as each increment is delivered.
- In incremental model of software engineering, waterfall model is repeatedly applied in each increment. The incremental model applies linear sequence in a required pattern as calendar time passes. Each linear sequence produces an increment in the world .

➤ **Advantages of using Incremental process model:**

- It has lower initial delivery cost.
- It has incremental resource deployment.
- It is good to use when requirements are known up-front.
- It is good to use when projects having lengthy developments schedules.
- It is good to use when project uses new Technology.

➤ **Why are we using incremental model?**

- Using this model, system will be easier to test and debug.
- Since there is much more potential of adding new functionalities in this system, Incremental model can be best choice for this system.
- An incremental model in real estate management systems allows for step-by-step development, making it easier to manage evolving requirements, reduce risks, and adjust to changes in regulations, budgets, and timelines.

4.3 Data Dictionary

1. City

This Table stores the information about City.

Field Name	Data Type	Constraints	Description
City_code	Int(6)	Primary key	Code of the city
City_name	Varchar(20)	Not Null	Name of the city

2. Area

This Table stores the information about Area.

Field Name	Data Type	Constraints	Description
Area_id	Int(2)	Primary key	Id of the area
Area_name	Varcahr(20)	Not Null	Name of the area

3. User

This Table stores the information about User.

Field Name	Data Type	Constraints	Description
User_id	Int(4)	Primary key	Id for user
F_name	Varchar(15)	Not Null	User first name
M_name	Varchar(15)	Not Null	User middle name
L_name	Varchar(15)	Not Null	User last name
DOB	Date	Not Null	User date of birth
Phone_no	Int(12)	Not Null	Contact number
Address	Varchar(50)	Not Null	User address
Password	Int(20)	Not Null	Password
E-mail	Varchar(30)	Not Null	User E-mail
Is_admin	bool	Not Null	For admin login

4. Property

This Table stores the information about Property.

Field Name	Data Type	Constraints	Description
Property_id	Int(3)	Primary key	Id for property
City_code	Int(2)	Foreign key	Id for city
Area_id	Int(2)	Foreign key	Id for area
Property_name	Varchar(20)	Not Null	Name of the property
Property_info	Varchar(30)	Not Null	All information about the property
Property_type	Varchar(10)	Not Null	Type of the property
Size	Float	Not Null	Size of the property
Amount	Int(8)	Not Null	Amount of the property
Amenities	Varchar(30)	Not Null	Amenities of thr property
Number_of_units	Int(2)	Not Null	Number of unit
Property_status	Varcahr(10)	Not Null	Status of the property

5. Inquiry

This Table stores the information about User.

Field Name	Data Type	Constraints	Description
Inquiry _id	Int(3)	Primary key	Id for inquiry
Property_id	Int(3)	Foreign key	Id for property
User_id	Int(4)	Foreign key	Id for users
Date	date	Not Null	Date of the inquiry
Description	Varchar(50)	Not Null	Description about the inquiry

6. Amenities

This Table stores the information about Amenities of Property.

Field Name	Data Type	Constraints	Description
Amenities _id	Int(2)	Primary key	Id for amenities
Property _id	Int(3)	Foreign key	Id for property
Description	Varchar(50)	Not Null	Description about the amenities
Amenities _type	Varchar(10)	Not Null	Type of the amenities

7. Tenant

This Table stores the information about Tenant.

Field Name	Data Type	Constraints	Description
Tenant_id	Int(3)	Primary key	Id for tenant
User_id	Int(3)	Foreign key	Id for User
Property_id	Int(3)	Foreign key	Id for property
Rent_amount	Int(5)	Not Null	Rent amount
Duration	Varchar(10)	Not Null	Duration of the rent

8. Image

This Table stores the details about Images of Property.

Field Name	Data Type	Constraints	Description
Image_id	Int(3)	Primary key	Id for image
Property_id	Int(3)	Foreign key	Id for property
Path	Varchar(30)	Not Null	Path of the image

9. Documentation

This Table stores all details of documentation of Properties.

Field Name	Data Type	Constraints	Description
Documentation_id	Int(3)	Primary key	Id for Documentation
Tenant_id	Int(3)	Foreign key	Id for tenant
Property_id	Int(3)	Foreign key	Id for property
Monthly_rent	Int(5)	Not Null	Monthly rent
Security_deposite	Int(5)	Not Null	Deposit
Starting_date	Date	Not Null	Starting date
Ending_date	Date	Not Null	Ending date

10. Booking

This Table stores information about Booking Property.

Field Name	Data Type	Constraints	Description
Booking_id	Int(3)	Primary key	Id for booking
User_id	Int(3)	Foreign key	Id for user
Tenant_id	Int(3)	Foreign key	Id for tenant
Transaction_id	Int(3)	Foreign key	Id for transaction
Amonut	Int(5)	Not Null	Amount of booking
Date	Date	Not Null	Date of booking
Statues	bool	Not Null	Status of booking

11. Discount

This Table stores information about Discount of the Property.

Field Name	Data Type	Constraints	Description
Discount_id	Int(3)	Primary key	Id for discount
Property_id	Int(3)	Foreign key	Property id
Discount_Percentage	Float	Not Null	Discount Percentage Of property
Duration	Varchar(10)	Not Null	Duration of the discount
Started Date	Date	Not Null	Starting date
Ending date	Date	Not Null	Ending date

12.Transaction

This Table stores all details of Transaction.

Field Name	Data Type	Constraints	Description
Transaction_id	Int(3)	Primary key	Id for Transaction
User_id	Int(3)	Foreign key	Id for user id
Booking_id	Int(3)	Foreign key	Id for booking
Tenant_id	Int(3)	Foreign key	Id for tenant
Amount	Int(5)	Not Null	Transaction amount
Date	Date	Not Null	Transaction date

Transaction_type	Varchar(10)	Not Null	Transaction type

13. Feedback

This Table stores details about feedback of Property.

Field Name	Data Type	Constraints	Description
User_id	Int(3)	Primary key	User id
Property_id	Int(3)	Foreign key	Property id
Date	Date	Not Null	Date of feedback
Description	Varchar(100)	Not Null	Description about the property

14. Rating

This Table stores details about Rating of Property.

Field Name	Data Type	Constraints	Description
User_id	Int(3)	Primary key	User id
Property_id	Int(3)	Foreign key	Property id
Date	Date	Not Null	Date of rating
Rating_value	Int(5)	Not Null	Value of rating

4.4 User Interface

1. Home Page

2. Sign up Page

The screenshot shows the sign-up page of AashrayRealty.com. The header is similar to the homepage, with the company logo and name on the left, and a navigation menu with links for Home and Log In on the right. The main content area is titled "Create Account" in a bold, black font. Below the title, a line of text reads "Please fill in your details to create an account.". There are two input fields: one for "Email" and one for "Password". Below these fields is a blue "Sign Up" button. Underneath the button, there are two social media login options: "Sign Up with Google" and "Sign Up with Facebook", each with its respective icon. At the bottom of the form, there is a link that says "Already have an account? Login".
